NOTE. The Group Quarters (GQ) population is included in the 2006 ACS and not included in the 2005 or earlier ACS. Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted as providing a 90 percent probability that the interval defined by the estimate plus and minus the margin of error (the lower and upper confidence bounds) contains the true value.
